

Mobilising all players for prevention

Fredrik Meurman
Head of Division,
City Planning and Building,
Swedish Housing and Development Agency (Boverket)

If you can plan for it –why worry?

- Raising temperature and increasing rainfall, storms
- Melting ice and increasing sea level, landslide and erosion
- Building material is affected and destroyed

Background-the Swedish planning system

- Three levels
- Strong local authority
- Democracy and participation

Level of Authorities

- The Government
- 20 Central authorities
- Laws and regulations

Level of Authorities

- 21 County Boards
- Emergency management
- Planning support

Level of Authorities

- 290 Local authorities
- Decides about planning and building

The climate doesn't know that we have different laws in different countries

- *The human memory is short*
- *Good planning helps us to keep things in mind*

In the planning system

- The Swedish building regulations best for new exploitation
- The builder is responsible
- In existing structures completed with other laws.
- Build new houses in an area that can be flooded.

In the building

- **Protection in new buildings**
 - Use ground floor for carparking
 - Cellar water-proof without windows.
 - Open foundation which can be overflooded
 - "Green" roofs for rainwater.
- **Protection in existing buildings**
 - Toilets with stop/reverse valve
 - Cellar windows can be plugged
 - Doors with flood-protection
 - Drain and sewer with stop/reverse valve

Do you know what your neighbours do?

- Many good examples
- Geology landslide and flooding in Umeå.
- Secure banks in Karlstad
- Benchmarking

Ecology and life-style questions are important!!

- Less green areas
- Building near rivers and seas
- Complicated technical solutions
- Reduction of impact by ecological systems

Thank you for your attention!
